

**IN THE CLAIMS**

Claims 1-28 (cancelled).

29. (previously presented) A doctor blade mounting system liquids to a rotatable cylinder in printing equipment comprising an elongated frame mounted adjacent to said rotatable cylinder, said elongated for applying frame including a support and a clamping portion mounted with respect to said support, said clamping portion manufactured to include an elongated slit having a predetermined profile having a first side and a second side defining an opening, a doctor blade disposed within said elongated slit parallel to said rotatable cylinder for operative wiping engagement with said rotatable cylinder, said doctor blade including a first side and a second side corresponding to said first and second sides of said elongated slit, respectively, and clamping means for fixing said doctor blade within said elongated slit, said second side of said elongated slit presenting a substantially planar surface for said second side of said doctor blade, whereby said doctor blade can be held along said substantially planar surface of said second side of said elongated slit with a substantially even clamping force, and said first side of said elongated slit presenting a contoured surface including an outer end having a first predetermined dimension corresponding to the entrance into said elongated slit, an intermediate portion having a second predetermined dimension, said second predetermined dimension being greater than said first predetermined dimension, and an inner portion having a third predetermined dimension, said third predetermined dimension being smaller than said first and second predetermined dimensions, said clamping means comprising an elastomeric material disposed within said elongated slit and accessible for removal from said opening in said slit with said doctor blade disposed therein whereby said elastomeric material can fit and lock within said predetermined profile of said

elongated slit and said elastomeric material is resiliently disposed with respect to said first side of said doctor blade to provide a damping action for said doctor blade, and is removable from said opening to assist in subsequent removal of said doctor blade from said elongated slit.

30. (previously presented) The doctor blade mounting system of claim 29 wherein said clamping means is tightly received within said predetermined profile of said elongated slit.

31. (previously presented) The doctor blade mounting system of claim 29 wherein said clamping means fixes said doctor blade by means of friction.

32. (previously presented) The doctor blade mounting system of claim 29 wherein said clamping means supports at least said first side of said doctor blade disposed within said predetermined profile of said elongated slit.

33. (previously presented) The doctor blade mounting system of claim 29 wherein said clamping means is resiliently disposed within said predetermined profile of said elongated slit.

34. (cancelled).

35. (previously presented) The doctor blade mounting system of claim 29 wherein said clamping means comprises at least one elastomeric member.

36. (previously presented) The doctor blade mounting system of claim 35 wherein at least a portion of said elastomeric member is in the shape of a wedge strip comprising a

shape intended to cooperate with said contoured surface of said first side of said predetermined profile of said elongated slit.

37. (previously presented) The doctor blade mounting system of claim 35 wherein at least a portion of said clamping means supports an edge of said doctor blade disposed within said predetermined profile of elongated slit.

38. (previously presented) The doctor blade mounting system of claim 35 wherein said elastomeric member has a hardness of about 70 degrees Shore.

39. (previously presented) The doctor blade mounting system of claim 29 wherein said support and said clamping portion comprise separate parts, and said support includes at least one end portion, and wherein said clamping means resiliently clamps said clamping portion to said end portion of said support.

40. (previously presented) A doctor blade mounting system comprising a doctor blade clamping portion comprising a solid material manufactured to include a slit having a predetermined profile including a first side and a second side defining an opening for receiving said doctor blade, said doctor blade including a first side and a second side corresponding to said first and second sides of said slit, respectively, and clamping means for clamping said doctor blade within said slit, said second side of said slit presenting a substantially planar surface for said second side of said doctor blade, whereby said doctor blade can be held along said substantially planar surface of said second side of said slit with a substantially even clamping force, and said first side of said slit presenting a contoured surface including an outer end having a first predetermined dimension corresponding to the entrance into said

slit, an intermediate portion having a second predetermined dimension, said second predetermined dimension being greater than said first predetermined dimension, and an inner portion having a third predetermined dimension, said third predetermined dimension being less than said first and second predetermined dimensions, said clamping means comprising an elastomeric material disposed within said elongated slit and accessible for removal from said opening in said slit with said doctor blade therein whereby said elastomeric material can fit and lock within said predetermined profile of said slit and said elastomeric material is resiliently arranged to provide a damping motion for said first side of said doctor blade, and is removable from said opening to assist in subsequent removal of said doctor blade from said slit.

41. (previously presented) The doctor blade mounting system of claim 40 wherein said clamping means is tightly received within said predetermined profile of slit.

42. (previously presented) The doctor blade mounting system of claim 40 wherein said clamping means fixes said doctor blade by means of friction.

43. (previously presented) The doctor blade mounting system of claim 40 wherein said clamping means supports at least said first side of said doctor blade disposed within said predetermined profile of slit.

44. (previously presented) The doctor blade mounting system of claim 40 wherein said clamping means is resiliently disposed within said predetermined profile of slit.

45. (previously presented) The doctor blade mounting system of claim 40 wherein said clamping means is removably disposed within said predetermined profile of slit.

46. (previously presented) The doctor blade mounting system of claim 40 wherein said clamping means comprises at least one elastomeric member.

47. (previously presented) The doctor blade mounting system of claim 46 wherein at least a portion of said elastomeric member is in the shape of a wedge strip comprising a shape intended to cooperate with said contoured surfaced of said first side of said predetermined profile of slit.

48. (previously presented) The doctor blade mounting system of claim 46 wherein at least a portion of said clamping means supports an edge of said doctor blade disposed within said slit.

49. (previously presented) The doctor blade mounting system of claim 46 wherein said elastomeric member has a hardness of about 70 degrees Shore.

50. (previously presented) A chambered doctor blade mounting system for applying liquids to a rotatable cylinder in printing equipment comprising an elongated frame mounted adjacent to said rotatable cylinder, said elongated frame comprising a support and a pair of clamping portions, a pair of elongated doctor blades mounted on said pair of clamping portions whereby said pair of elongated doctor blades are disposed parallel to said rotatable cylinder for operative wiping engagement with said rotatable cylinder, each of said pair of clamping portions manufactured to include an elongated slit having a predetermined profile including a first side and a

second side defining an opening for receiving each of said pair of elongated doctor blades, each of said pair of elongated doctor blades including a first side and a second side corresponding to said first and second sides of said elongated slit, respectively, said pair of clamping portions and said support comprising separate parts, said support including a pair of end portions, said second sides of said elongated slits presenting substantially planar surfaces for said second sides of said pair of elongated doctor blades, whereby said doctor blades can be held along said substantially planar surfaces of said second sides of said elongated slits with a substantially even clamping force, and said first side of said elongated slit presenting a contoured surface including an outer end having a first predetermined dimension corresponding to the entrance to said elongated slit, an intermediate portion having a second predetermined dimension, said second predetermined dimension being greater than said first predetermined dimension, and an inner portion having a third predetermined dimension, said third predetermined dimension being less than said first and second predetermined dimensions, and clamping means comprising an elastomeric material disposed within said predetermined profile of said elongated slit and accessible for removal from said opening in said elongated slits with said doctor blade therein whereby said elastomeric material is resiliently clamping said clamping portion to said pair of end portions of said support, and is removable from said opening to assist in subsequent removal of said doctor blades from said elongated slits.

51. (previously presented) A method for removably clamping a doctor blade in a clamping member comprising an elongated clamping member comprising solid material, said elongated clamping member including a first side and a second side defining an elongated slit including an opening for

introduction of said doctor blade including a first side and a second side corresponding to said first and second sides of said elongated slit, respectively, said method comprising manufacturing said elongated clamping member so that said elongated slit has a predetermined profile, inserting a portion of said doctor blade into said predetermined profile of said elongated slit through said opening with said second side of said elongated slit presenting a substantially planar surface for said second side of said doctor blade, whereby said doctor blade can be held along said substantially planar surface of said second side of said elongated slit with a substantially even clamping force, and said first side of said elongated slit presenting a contoured surface including an outer end having a first predetermined dimension corresponding to said opening into said elongated slit, an intermediate portion having a second predetermined dimension, said second predetermined dimension being greater than said first predetermined dimension, and an inner portion having a third predetermined dimension, said third predetermined dimension being less than said first and second predetermined dimension, and thereafter inserting resilient clamping means into said elongated slit through said opening for resiliently supporting said first side of said doctor blade within said elongated slit, said resilient clamping means including a surface cooperating with said contoured surface so as to fit and lock said resilient clamping means within said predetermined profile of said elongated slit.

52. (previously presented) The method of claim 51 including lubricating said clamping means prior to inserting said clamping means into said predetermined profile of said elongated slit.

53. (previously presented) The method of claim 52 wherein said clamping means comprises an elastomeric member, and including manually inserting said clamping means into said predetermined profile of said elongated slit.

54. (previously presented) The method of claim 51 including attaching said clamping means to a substantially U-shaped support.

55. (cancelled).

56. (cancelled).

57. (previously presented) The doctor blade mounting system of claim 29, wherein said elastomeric material comprises a first elastomeric material, and including a second elastomeric material disposed within said elongated slit on said second side of said doctor blade thereby providing said substantially planar surface.

58. (previously presented) The doctor blade mounting system of claim 29, wherein said doctor blade has a thickness of between about .06 and 2 mm, and wherein said elastomeric material comprises a material softer than said doctor blade.

59. (previously presented) The doctor blade mounting system of claim 29, wherein only up to about 30% of the entire length of said doctor blade is disposed within said elongated slit.
